

# “What the World Needs Now IS A SENSE OF HUMUS”

**Compost instead of waste to breed Earth worms and make humus-soil; Helping nature to grow the healthiest foods, is FUN-WORK, not toil.**

Towards achieving a no-waste society, this campaign is motivating the world community to reduce, reuse and recycle all used plastics to re-manufacture into composting bins for every home yard in cities and towns world-wide.

The bins are hygienic, aerobic and conical shaped, like the bins pictured here, although these bins have had eight x 3mm holes drilled into them in a symmetrical grid, and one in the lid, providing continuous aeration, enabling optimal bio-degradation and an efficient no-dig method.

Composting bins can be used in every home yard to stop the waste, and to process ALL the continuously available bio-degradable resources. This will produce increasing quantities of earth worms and humus-rich soil to use in helping grow permaculture-designed urban and rural food-forests in all appropriate places.

As this activity accelerates globally, it will enable unlimited ethical and honourable employment, enhance local and global co-operation, produce an abundance of fresh,

healthy, living plant foods and ensure ongoing food security for all time. It also has the potential to help mitigate climate change and reverse global warming.

**Every compost stack is an earth repair bank and every deposit made is an investment into a sustainable future.**

Please share this thought-seeding strategy with your friends and families and be part of the solution to help accelerate Vision 2030 towards a world community of caring and sharing people living in good health, peace, happiness and abundance.

This campaign is being conducted by the Earth Repair Foundation (ERF).
